Description

Its becoming almost a necessity to have some kind of alert system that are articulated with the hosts facts.
After having multiple facts that are critical and therefore must be monitored, Its becoming more and more difficult to keep tracks of them with a the "Monitor Search Filtering", and even then its just only a solution for active monitoring.

Through the creation of puppets, one could virtually "facterize" anything from a hosts (like low disk space, or apache service down) and have the alerts triggered, notified in Katello's UI with the hosts that have facts within reach of some values. Is there anything in that lines being thought to put it in the roadmap?

History

#1 - 05/04/2015 08:44 PM - Eric Helms

- Project changed from Katello to Foreman

- Category deleted (Web UI)

#2 - 05/20/2017 06:00 AM - Anonymous

- Status changed from New to Resolved

There's a notification system now. The other part is more something like nagios.
