Description

The Foreman summary email is currently titled in a static way - it's always the same title. This means that if I move away from my desk for a few hours (I use hourly reporting), I'll have a bunch of identical emails which may or may not be useful to me.

I think it would be nice to have the email title generated from the data contained within the email - something like this:

Summary Puppet report from Foreman - F:10 R:2 S:5 A:7 FR:0 T:24

Where F = failed, S = skipped and so on, as per the headers in the email table. T is the total of the preceding numbers.

This would allow an at-a-glance scan of your inbox, as well as custom mail filters to mark certain mails as important without having to scan the body (good for IMAP).
