Description

Cloned from https://bugzilla.redhat.com/show_bug.cgi?id=1234973

Description of problem:

A config template has at least the following attributes:

- audit_comment
- id
- locked
- name
- operatingsystem
- organization
- snippet
- template
- template_combinations
- template_kind

When one updates a config template, the following attributes are returned:

- created_at
- default
- id
- locked
- name
- snippet
- template
- template_kind_id
- updated_at
- vendor

The following attributes are missing from the response:

- audit_comment
- operatingsystem
- organization
- template_combinations

Version-Release number of selected component (if applicable):

Satellite 6.1.0. Foreman-debug is attached.

How reproducible:

100%

Steps to Reproduce:

1. Issue HTTP PUT request to https://sat.example.com/api/v2/config_templates/:id
2. Capture the response. Examine the JSON payload and discover that several attributes are not mentioned.
- 3.

Actual results:
See "Description of problem" section.

Expected results:
See "Description of problem" section.
