Description

Variables don't work as values for group settings.

If I have:

foo = a
bar = b
red = $foo-$bar

and I reference $red, it is interpreted as $foo-$bar literal.

- Description updated

- Status changed from Feedback to Closed

Hello,

Now with Foreman 1.3 you can use ERB templating in parameters. This will solve your needs of variables in Parameters.

Regards,

Benjamin Papillon
