#### Description

1. Open up the Subnets index page
2. Open up the New Host form in a separate tab
3. Select a subnet in the New Host form with IP suggestions, which should populate
4. Select a subnet to edit on the Subnet index
5. Save the subnet

It will redirect the two pane page to /hosts/new, so you end up with an embedded New Host form in the pane (see screenshot).

What appears to be happening is that the AJAX request on the New Host form hits the subnet controller, which triggers the `store_redirect_to_url` filter in `app/controllers/concerns/foreman/controller/auto_complete_search.rb`. The filter should probably only store the URL if `!ajax?`.

This might happen with other controllers, such as images which is used for CRs in the New Host form.
