Pull request:	
Description Cloned from https://bugzilla.redhat.com/show_bug.cgi?id=1221658 Description of problem: Edit page for hosts created on vmWare shows always default network for network interfaces and does not reflect the actual values on the compute resource. Version-Release number of selected component (if applicable): How reproducible: Steps to Reproduce: 1. Create a host on vmWare with a network interface (on the "Virtual Machine" tab) on a network other than the default in the combo box. 2. Go to the host's edit page, switch to the "Virtual Machine" tab 3. The field "Network" for the interface shows the default value instead of the selected one. Expected results: Even though the value is only informative and is not editable, it should be displayed correctly.
