

Foreman - Bug #11689

Hidden value checkbox on global parameter form doesn't replace editor

09/04/2015 05:06 AM - Dominic Cleal

Bugzilla link:	Red Hat JIRA:
Pull request: https://github.com/foreman/foreman/pull/2706	
Description	
When editing a global parameter, the "Hidden value" checkbox doesn't replace the full editor (added in #11625) when checked, and the new textbox stays there when unchecked.	
1. Edit a non-hidden parameter, check the "Hidden value" box and a new textbox appears between the editor toolbar and textarea. The old non-hidden value is still shown in the textarea.	
2. Untick the "Hidden value" box and the new textbox remains.	
3. Create a hidden parameter, untick the "Hidden value" box and the password field is replaced by a textbox and not the editor.

What's the expected behavior when the hidden value checkbox is checked?

It looks like it used to turn the text field into a password input which is grotesquely unsemantic and could even automatically be populated by a password via the browser or some plugin.

Does it really make sense to mask the input on the edit page? I understand not showing it on the list page but if you are going to edit a value, aren't you likely to want to see it?

#3 - 09/10/2015 03:24 AM - Dominic Cleal

Yes, the previous behaviour is the expected behaviour - to swap the text box for a password/hidden field and back.

Okay, but I will mask the value using something other than a password field.
