

Foreman - Bug #1178

Foreman tries to use autosign.conf when not required

Description	
When using a smart-proxy for your Puppet CA, foreman still attempts to use /etc/puppet/autosign.conf. If it does not have permission to it, it will not be able to build the host and you get an error in production.log.

if the smart proxy is defined and you selected in the host level (e.g. the drop down next to the puppetmaster field), you should not get that message.

that code is part of the legacy foreman code, and should be removed
