Description

On our puppetmaster we have three environments setup using modulepaths that aren't /etc/puppet/modules.

In the GUI, if I do:

- 1) Settings -> Puppet Classes
- 2) Import New Puppet Classes and Environments

I get a popup error:

"Unable to find directory /etc/puppet/modules in environment production"

Gonna search bug tracker for this issue and am planning an upgrade to trunk to see if maybe it is resolved.

I think this is solved already - could you try the suggestion in the following comment:

<http://theforeman.org/issues/1159#note-8>

#3 - 01/29/2012 01:10 PM - Brian Gupta

Yes, that resolved it. However, I thought that was a "workaround" not a solution, which is why I kept the ticket open. (My apologies for not updating the ticket sooner.)

Hello,

My thoughts are it is considered the good solution for the 0.4 version.

For the new 1.0 version, this solution is not valid anymore as you have to use smart proxy to import environments and classes
