Description

Hi All,

With reference to http://projects.theforeman.org/issues/12962 I am trying to kickstart the xenserver via foreman but the problem is while adding Installation Media & Operating system (Operating system family) I have no clue which family to select because if I choose redhat or debian the path and file structure it looks was wrong.

It will be great how to add operating system family module in foreman for xenserver

It isn't possible to add a family without changing Foreman's code. Going back to that issue, some in-progress code was linked in the first comment which would need to be proposed, merged and released.
