Triaged:		Found in Releases:
Bugzilla link:		Red Hat JIRA:
Pull request:		
Description 1. don't use any proxy features for provisioning (no dns/dhcp/tftp) 2. use image-based provisioning without cloud-init (the ssh based) 3. try to create a host (I've tested with libvirt) The host gets created even when no IP address specified. I've tested this with libvirt, but I guess the issue is the same with all providers that don't provide the IP address via the API.
