Description

Rails 4.1 adds a secrets.yml file that should be configured with a secret_key_base per environment. This replaces the secret token initialiser. Deprecation warnings are currently being issued by Rails:

```
DEPRECATION WARNING: You didn't set `secret_key_base`. Read the upgrade documentation to learn more about this new config option. (called from validate_secret_key_config!
```

http://edgeguides.rubyonrails.org/upgrading_ruby_on_rails.html#config-secrets-yml has more info.

This will need some updates to packaging too, since we have scripts to generate the tokens and link the files into the right place post-installation.
