Foreman - Bug #14130

Libvirt image provision generates random MAC address, even though you supply one during provision

Description

Hi!

When creating a new host and editing the interface, supplying a MAC address, the host is provisioned with a different, random generated MAC address instead.

As I cannot have proxy for DHCP, I need to set a MAC address so I can manually register it in DHCP beforehand with IP address so that the provisioned host gets that address, for the SSH finish to work.

Steps to reproduce:
Provision new host on libvirt provider
Supply MAC address in "Interfaces > Edit"
The host is created with another, random MAC address.

Expected result:
The host is created with the supplied MAC address.

TIA
Karli
