Description

Each integration test currently runs the login_admin integration test helper which navigates to the index page, fills in the login form and submits it before running the main contents of the test. This is inefficient and adds two requests and some time to the execution of each test.

The login process should be removed from the test steps and tested once by itself, instead of on every integration test. The SSO mechanism in Foreman can be used to automate the login process instead.

Revision 5c02935a - 03/21/2016 09:34 AM - Dominic Cleal

fixes #14291 - replace integration test logins with SSO

Replace the loading and form-filling on the user login page with a test-only SSO method, which automatically logs in the test user on every request. This uses a cookie sent in the request to specify the user.
