Description

I'm still very new with Foreman and have found the wiki to be really helpful.   I'm reading and following through this URL

http://theforeman.org/projects/smart-proxy/wiki/Tftp

on how to setup tftp to work with foreman. I di have a tftp server and that is working fine.   I thought by modifying the file /etc/foreman-proxy/settings.yml

and placing my tftp server name under

:tftp_servername:

the smart-proxy will update the configuration under my tftp server. I do not see this.   What I do see is that the updates are being made on my foreman server.   Would I need to make the foreman server a tftp server as well?

Thanks,
Thomas

make sure you have a subnet defined, and that it has a tftp proxy configured...

#2 - 01/10/2012 10:51 AM - Thomas Go

Hi,

I have a subnet defined. Under /etc/foreman-proxy/settings.yml

I have defined

:tftp: true
:tftproot: /tftpboot
:tftp_servername: myserver.name.com <--I have my hostname here.

I do see tftp configuration created in my foreman server, but not my tftp server. It doesn't update my tftp server.   Do I need to configure my foreman server to run tftp?

What I want to do is pxeboot from my tftp server.   Would I need to pxeboot from the foreman server?

Thanks,
Thomas

foreman proxy is running?
Do you have any log files from proxy?
Is the foreman-proxy selected on host creation?

Hello,

Can you provide feedback related to this issue?
Is foreman working for you now?

Regards

Edit: Hum, your problem seems solved when reading your other issue ([#1444](#))
