Katello - Bug #15216

Installer fails if Satellite hostname doesn't have a TLD at the end of the domain

05/27/2016 12:52 PM - Bryan Kearney

Status:	Rejected		
Priority:	Normal		
Assignee:	Mike McCune		
Category:	Installer		
Target version:	Katello Recycle Bin		
Difficulty:	easy	**Fixed in Releases:**	
Triaged:	Yes	**Found in Releases:**	
Bugzilla link:	1127307	**Red Hat JIRA:**	
Pull request:	https://github.com/Katello/katello-installer/pull/348		

Description

Cloned from https://bugzilla.redhat.com/show_bug.cgi?id=1127307
Users with domains containing hyphens are unable to install Satellite 6, they get errors during installation:

[root@sat6 ~]# katello-installer
/Stage[main]/Foreman_proxy::Register/Foreman_smartproxy[sat6.test.example-domain]: Could not evaluate: 500 Internal Server Error
Installing   Done   [100%]

We need to determine why Satellite 6 can't be installed on systems with a domain including a hyphen and support this use case.

Steps to reproduce:

1) Setup a system who's domain name resolves to something with a hyphen:

sat6test.example-domain.com

2) Attempt to run katello-installer

3) note errors
