

Foreman - Bug #1529

Cannot delete an host for which puppet does not have a certificate

Description		
Hi,		
While playing with provisioning (libvirt) guest hosts, I've been hit by a bug that prevent me from deleting a host using the Foreman GUI.		
The host is created using the Foreman web interface. It's a libvirt guest, using a custom PXELinux provisioning template.		
When trying to delete it before it has registered to the puppet master, I have the following error message:		
Failed to remove test3.vm.logilab.fr's puppet certificate: Failed to remove certificate(s) for test3.vm.logilab.fr: SSL/CA unavailable on this machineFailed to generate PXELinux template: Missing host to link to! Please provide :host parameter or set default_url_options[:host]Failed to perform rollback on DHCP Settings for test3.vm.logilab.fr - undefined method `create' for nil:NilClass		

History

#1 - 03/13/2012 04:26 PM - David Douard

Just realized I did not tell that I am using the stable deb package you provide (aka 0.4.2).

#2 - 03/13/2012 04:55 PM - David Douard

The problem persist with latest nighty build deb package (0.5-~nightlybuild1322446320).

As a quick and dirty fix, I've just made the "failure" statement in the delCertificate (app/models/orchestration/puppetca.rb) a "logger.info". This allowed me to remove the host from the web UI.

#3 - 09/27/2012 02:13 PM - Joshua Hoblitt

This issue is still present in foreman-1.0.1-1.el6.noarch.

Failed to remove test.xxx's puppet certificate: 406 Not Acceptable
Failed to generate PXELinux template: Missing host to link to! Please provide :host parameter or set default_url_options[:host]

My crude workaround is to run `puppetca generate test.xxx` and then delete the host from the foreman UI.

#4 - 10/12/2012 02:53 PM - Greg Sutcliffe

This shouldn't happen unless you are using puppet 2.7.19 with the stable proxy - I certainly can delete hosts with no certificate in Foreman 1.0.1. Can you confirm if that's your setup? (2.7.19, stable proxy)

#5 - 10/12/2012 02:55 PM - Joshua Hoblitt

That is indeed my setup

[root@ctrl ~]# rpm -qa | egrep 'foreman|puppet'

```
puppet-2.7.19-1.el6.noarch
foreman-1.0.1-1.el6.noarch
foreman-release-1.0.1-1.el6.noarch
foreman-proxy-1.0.0-3.el6.noarch
foreman-libvirt-1.0.1-1.el6.noarch
foreman-cli-1.0.1-1.el6.noarch
foreman-ec2-1.0.1-1.el6.noarch
foreman-console-1.0.1-1.el6.noarch
puppetlabs-release-6-6.noarch
puppet-server-2.7.19-1.el6.noarch
rubygem-foremancli-1.0-1.el6.noarch
```

#6 - 11/13/2012 12:04 PM - Greg Sutcliffe

- *Target version set to Bug scrub*

#7 - 11/15/2012 04:45 AM - Ohad Levy

- *Status changed from New to Resolved*

so all's required is to update the proxy
