Description

It would be helpful if the rendering of a provision template would append a newline character.

I was wondering why the last operation in a kickstart template I wrote up would not be executed. I realised after pulling the template with curl that the kickstart file would end w/o \n. Might be specific to anaconda (version shipped with CentOS 5), though. Appending an empty line to the template fixed that, of course :)

I think this depends on if you use > as closing statement vs ->

-%> means, no EOL, so maybe simply changing it to %> should work?
