I'd suggest ensuring the kernel/initrd on your TFTP server (e.g. /var/lib/tftpboot/boot) exactly match what's on the mirror, and that they're not from the ISO image you previously tried using.

Thank you for the suggestion Dominic Cleal, Based on 'Michael Moll' update in previous issue I've done the local mirror setup from: <http://archive.ubuntu.com/ubuntu/>

i just use the "http://archive.ubuntu.com/ubuntu/" as Installation Media path instead of my local mirror, still the same error(image already attached: pkg-error.jpg) occurring on the unattended installation. Is there a solution or how to overcome / skip the issue by modifying the OS templates in foreman ?

Hi,

Is there any update about this issue ?

#5 - 12/02/2016 04:27 PM - William Carlson

I saw this same issue and a google search got me here. In case others see it I resolved it by changing the partition layout to "Preseed default" from "Preseed custom LVM".

Hi William Carlson,

It worked for me, Thank you so much. But i got the error in salt pkg installation, since i have place the salt minion pkg and its dependencies from: <http://debian.saltstack.com/debian/> on the path(my/local/repo/ubuntu/pool/universe/), did i missing anything or kindly suggest me to short out this issue.

Regards,
Ranjithkumar.T

- Status changed from New to Resolved

Setting to resolved as the salt mirror thing is unrelated.
