Description	
<p>Those of us who are migrating from Cobbler are used to seeing a "View Kickstart" button which will show the rendered kickstart template for a specific host with the variables. This function would show the output of this:</p> <p>http://foreman/unattended/provision?spooof=x.x.x.x</p> <p>This is useful in troubleshooting template/kickstart problems. There should be a button, or easy way to access this URL from the UI.</p>
