

Foreman - Bug #1697

The puppet modules are shown in all environments, while should be limited to the environment they reside in.

Description		
<p>The puppet modules are shown in all environments, while should be limited to the environment they reside in. The situation is as following: Someone create a puppet module under a particular environment on the file system (under /etc/puppet/modules/<environment name>/). When I add this module to foreman, I see it under all environments and I'm able to add it to any hostgroup that resides in any environment. I'd expect having the modules added under a particular environment to be available only for that environment. Seeing modules from other environments is very confusing and forces checking the existence of the files on the host. Thanks.</p>
