| Description Open the Puppetclasses page, edit a puppetclass. Go to the Smart-Variables tab, edit or create a smart-variable. We'll add 3 errors: <ul style="list-style-type: none">• put a blank name• select a type validator of "regexp"• type "^good" in validator constraint• type "foo" as default value• add a matcher, type "bar" for its value Submit the form. We have two kinds of problem: <ul style="list-style-type: none">• The Smart-variables tab isn't highlighted in red (check for each smart-var to be so too)• (The name field has no problem and has a help_inline of "can't be blank")• The default value and matcher value fields are completely broken and appear partially as raw text. I suspect the fields with errors suddenly no longer understand the :help_inline attribute, that gets written as an arbitrary HTML tag argument, which is unfortunately .html_safe. | |
