| <b>Description</b>   |        |                           |
| Right now the first parameter that ends up with "_id" will be considered as a parent resource.                             |        |                           |
| We need a way to blacklist some parameters so that they will not be considered as parents.                                 |        |                           |
| The code boils down to BaseController#parent_resource_details which iterates through all parameters passed to the request. |        |                           |
