Foreman - Bug #17509

Smart Proxy status for TFTP Server service incorrectly displays "false"

11/28/2016 04:26 PM - Andrew Bobulsky

Status:	New

Bugzilla link:		**Red Hat JIRA:**	
Pull request:			

Description

Foreman is provisioning machines via PXE properly, and logs show that the TFTP server is servicing requests, but when navigating to

- **Infrastructure** > **Smart Proxies**
- Click Smart Proxy FQDN
- Click **Services** tab

...and in the section for TFTP, the **TFTP Server** section shows **false**.

I mentioned this to Ohad Levy on IRC, and he said:

> thats actually a bug in displaying the data, as the tftp proxy has the ability to override its name from configuration, so if its not set, then its shows as false.

Here's a screenshot showing the bug in action:

 4afRdEE.png
Finally, for reference, I used the following line to perform my foreman installation

foreman-installer --scenario katello --foreman-proxy-dhcp=true --foreman-proxy-dns=true --foreman-proxy-tftp=true

... at least the last time I ran it. I had initially specified more options, but I reset it over a dozen times.
