Pull request: https://github.com/foreman/foreman/pull/4068	
Description	
Few customers have requested support for wanting short host names and do not want domain names appended. They want to select domain names and want the resolv.conf info on their hosts filled correctly.	
Issue http://projects.theforeman.org/issues/2975 handled some of this but was tagged as vm only. We need it to be generally applicable.

Revision e87d9bee - 01/18/2018 03:39 PM - Partha Aji

Fixes #17521 - Use short name for hosts

This commit enforces the policy of using short name for hosts while preserving the fqdn for interface values provided the user has enabled 'append_domain_name_for_hosts' Setting.

The description doesn't make much sense to me - the setting changes the name of the virtual machine, not the name of the host in Foreman. Hosts on CRs still have an FQDN.

This seems like a duplicate more of [#11989](#), creating hosts without a domain.

The "shortcode for VMs" setting should not be used to change the behaviour of the "name" field within Foreman, that is not its purpose - it's meant to only affect VM names.

Added a new setting "append_domain_name_for_hosts" that will now always be set. The user can unset this and in that case the domain name will

not get attached.
