Such an error message will not appear on rubies version 2.1 and higher. Socket.tcp_server_sockets method used by webrick to start listening for connections [1] now silently discards errors as long as one address out of multiple is available for listening on [2]. In previous versions of ruby webrick was handling these errors and was logging them as warnings [3]. As 2.0.0 is the last version of ruby that has this issue, I'd opt for leaving things as is.
