Description	
<p>Hey, Ruby implementation and version: Not Sure Rails version: Not sure OS: rhel 7 DB: postgres Ruby-aware server used: Webrick</p> <p>When i'm using the web gui and trying to create new proxy for the first time after installing foreman on Server1 and foreman-proxy on Server2, I get the following error: Unable to communicate with the proxy:ERF12-2530[ProxyAPI::ProxyException]: Unable to detect features ([OpenSSL::SSL:SSLError]: HOSTNAME "Server2" doesnot match the server certificate) for proxy https://Server2:8443/features Please check the proxy is configured and running on the host.</p> <p>This is how i created the crtificates: I ran this command on Server1(where foreman and puppet are installed): puppet cert generate Server2.new and after that I copied those files which were generated from: private_keys/Server2.new certs/Server2.new and certs/ca.pem I copied it to Server2 and in settings.yml I pointed the ca's to those new files. ofcourse I changed the ownerships on those files to foreman-proxy so i can restart the service foreman-proxy proprley, and i also did some more instructions which provided in foreman website. still could not add the Server2 to the proxies list in Server1 web gui.</p>
