Description

Started playing with foreman_hooks and noticed that the json data passed to my hook script is missing host parameters when I create a new host. I started digging through commits and found that if i revert this commit:

https://github.com/theforeman/foreman/commit/94265cf7ab7e383fc864182efd443be0adfac1de#diff-5ef0189b17a78606adef8f22e909697e

in the app/views/api/v2/hosts/show.json.rabl file it works again.

So, this code (which nowadays is moved to main.json.rabl):

```
node do |host|
  { :parameters => partial("api/v2/parameters/base", :object => host.host_parameters.authorized) }
end
```

does not work for me but this do:

```
child :host_parameters => :parameters do
  extends "api/v2/parameters/base"
end
```

I'm running this as administrator in my Foreman installation, am I missing something or is this a bug?
