

Foreman - Bug #2066

puppet:import:puppet_classes repeatedly tries to remove environment that still contains nodes

Description	
<p>Sometimes clients do believe they're in the "production" environment, which is usually called "prod" around here. After one of them sent a report to the foreman, the environment becomes sticky: puppet:import:puppet_classes tries but doesn't remove the environment as there're still hosts in it.</p> <p>Either the task should recognise the futility and avoid trying to remove the environment, or it should be forceful enough to actually do so. The first option is less destructive. A log entry might help pointing to a fishy configuration, but also might be annoying if the brokenness of the environments is already known.</p>

This report can be closed. It seems there are still nodes reporting from the production environment, recreating it again and again. Sorry for the noise.

#2 - 12/20/2012 12:59 PM - Greg Sutcliffe

- Status changed from New to Rejected

No worries, it happens :)
