Description

In my master section of my puppet.conf I have the following modulepath:

modulepath = $confdir/environments/$environment/puppet_modules:/home/$environment/puppet_modules

For my personal testing environment (kcormier) I keep all of my modules under /home/kcormier/puppet_modules. /etc/puppet/environments/kcormier/puppet_modules does not exist. Neither does the parent directory /etc/puppet/environments/kcormier. Puppet works fine however foreman fails to import my classes and thinks the environment does not exist. If I create /etc/puppet/environments/kcormier, foreman will load my classes correctly. Just to note, /etc/puppet/environments/kcormier/puppet_modules still DOES NOT exist, however it's parent directory does.

This was found with foreman-proxy 1.1rc1 from the foreman-1.1.rc4 rpms running on centos 6.3 fully patched.
