Description	
Import of Ansible roles from Foreman host fails if roles_path contains multiple pathes which is the default with packages from Centos 7 extras repository. So it seems Foreman only supports roles_path = /etc/ansible/roles, while Ansible supports roles_path = /etc/ansible/roles:/usr/share/ansible/roles. There is no error logged and it only tells the user in the frontend that there are no changes in the case of multiple pathes.
