Foreman - Bug #2175

Import of two empty envs in fresh installation results in excessive updates to the database

Description

In 1.1rc5 when importing the empty production and development environments of a fresh setup through the locally running proxy the disk start thrashing for 30 seconds before succeeding to import the env's.

When that happens I can see /var/lib/foreman/db/production.* changing a lot so apparently there is a **lot** of work done in the database event though the environments are completely empty and the installation itself is pristine and has not any host defined yet.

History

Actually the environments aren't empty but contain the classes of the foreman installer.
Still for 8 classes the i/o involved seems to be excessive.
