Pull request:		
Description		
According to both the help page on templates and the template writing guide: https://projects.theforeman.org/projects/foreman/wiki/TemplateWriting#Host-or-host-group-parameters the follow syntax should work in templates: @host.param_true?('parameter_name') @host.param_false?('parameter_name') However, the use of param_true? throws an exception error: <div>Warning! There was an error rendering the Community Preseed default template: undefined method `pa ram_true?' for # Did you mean? parameters_url</div> Changing the syntax back to old style host_param_true?('parameter_name') resolves the issue and allows the template to render.

- Status changed from New to Resolved

There's a bug in the documentation, it should have said in 1.14 and earlier. In 1.15 and higher, you should use

host_param_true?('parameter_name')

I've updated the wiki and closing this as resolved. Please reopen if I misunderstood the request.
