Pull request:			

Description

Given a CV that is using an exclude filter for RPMS. The filter has a rule that is using version range on a package. After changing this rule to "Greater than",
no packages got excluded when publishing the CV.

Steps to Reproduce:
1. Create a CV with "Red Hat Enterprise Linux 7 Server RPMs x86_64 7Server " repo

2. Create an exclude fitler for kernel pacakge like this

Type: Exclude
RPM: kernel
Version "range": between 3.10.0-327.36.3.el7 and 3.10.0-693.36.3.el7

3. update the same filter rule created in 2 to:

Type: Exclude
RPM: kernel
Version "Greater than": 3.10.0-693.36.3.el7

4. publish the CV

Actual results:

Kernel 3.10.0-862.2.3.el7 is included

Expected results:

Kernel 3.10.0-862.2.3.el7 should not be included because it is higher than 3.10.0-693.36.3
