<b>Pull request:</b> <a href="https://github.com/Katello/katello/pull/7673">https://github.com/Katello/katello/pull/7673</a>	
<b>Description</b>	
<p>If you create a yum repo and add "upstream_password" to the repo via hammer (hammer -u admin -p changeme repository update --id 1 --upstream-password "foo"), katello will tell pulp to create a task to update the importer and return immediately back to the user.</p> <p>However, Pulp will give an error, and not update the importer:</p> <pre>**** PulpDataException: Configuration errors: The configuration parameter &lt;basic_auth_password&gt; requires the &lt;basic_auth_username&gt; parameter to also be set. ****</pre> <p>Katello should return this error back to the user instead of assuming the task was successful. Once this happens, subsequent updates to the importer will fail until the original issue is corrected, since the incorrect value is now in katello_repositories.</p>
