Pull request:	https://github.com/theforeman/foreman/pull/6258		

Description

Cloned from https://bugzilla.redhat.com/show_bug.cgi?id=1517257

Description of problem:

Version-Release number of selected component (if applicable):
Build:Satellite 6.3.0 snap26

How reproducible:
Always

Steps to Reproduce:
1. Provsion a Host on RHEV
2. Edit the host, go to Virtual machine tab. All options are greyed
3. Use the min max controller to increase the memory

Actual results:
The increase memory Config is sent to rhev and is applied on the Host's next run

Expected results:
1) The Memory field shouldn't be greyed out and it should show a not on editing, that changes would take effect in next run
OR
2) If we don't want the configuration edited from satellite ,Completely disable the min max field.

I think we should go with 1.

Additional info:
This behavior doesn't Happen with CPU Cores
