Pull request:	
Description Cloned from https://bugzilla.redhat.com/show_bug.cgi?id=1600167 Description of problem: In the host form, in fields like "Puppet Environment" the inherit button causes the value to be overwritten and uses the value from the host group. When a user clicks this it disables the field, however it still shows the old value. I noticed this with puppet environments, but it might be true for all fields with an inherit button. It might also be an issue in older version of satellite. How reproducible: Always Steps to Reproduce: 1. Create 2 puppet environments envA and envB 2. Create a Host group with a puppet environment (envA) 3. Create a host tied to the host group. 4. Edit the host, change to a different puppet environment (envB). Press Apply 5. Edit the host again, press inherit. Actual results: The field is greyed out, disabled, and the field shows the old puppet environment (envB) in this case Expected results: The field is greyed out, disabled, and the inherited environment is shown. Additional info: Screen recording of the issue: https://drive.google.com/file/d/1nyEVyNdJSGoa7C2ELyF5A4ZLFk7h2FDU/view?usp=sharing
