Foreman - Bug #24228

When using "inherit", inherited value is not shown

Description

Cloned from https://bugzilla.redhat.com/show_bug.cgi?id=1600167

Description of problem: In the host form, in fields like "Puppet Enviroment" the inherit button causes the value to be overwritten and uses the value from the host group.

When a user clicks this it disables the field, however it still shows the old value.

I noticed this with puppet environments, but it might be true for all fields with an inherit button. It might also be an issue in older version of satellite.

How reproducible: Always

Steps to Reproduce:
1. Create 2 puppet environments envA and envB
2. Create a Host group with a puppet environment (envA)
3. Create a host tied to the host group.
4. Edit the host, change to a different puppet environment (envB). Press Apply
5. Edit the host again, press inherit.

Actual results: The field is greyed out, disabled, and the field shows the old puppet environment (envB) in this case

Expected results: The field is greyed out, disabled, and the inherited enviroment is shown.

Additional info: Screen recording of the issue:
