Description	
Hello!	
I'm using an CentOS7 System with Katello.	
<pre>1. cat /etc/centos-release CentOS Linux release 7.6.1810 (Core) 2. rpm -q katello katello-3.2.2-1.el7.noarch #</pre>	
This week the x509 Certificate expired and I got new one from our CA. I placed the key, the certificate, the certificate signing request and the CA file inside /data/pki/tls and did run the following command:	
<pre>foreman-installer --scenario katello --certs-server-cert /data/pki/tls/certs/servername.domain.tld-base64.pem --certs-server-cert-req /data/pki/tls/certificatesigningrequest/servername.domain.tldRequest.pem --certs-server-key /data/pki/tls/private/servername.domain.tldKey.pem --certs-server-ca-cert /data/pki/tls/certs/rootca2018+subca2018-base64.pem --certs-update-server --certs-update-server-ca</pre>	
this command gives me the following error message:	
<pre>/Stage[main]/Qpid::Install/Package[python-qpid-qmf]/ensure: change from absent to present failed: Execution of '/bin/yum -d 0 -e 0 -y list python-qpid-qmf' returned 1: Error: No matching Packages to list</pre>	
On the system there is a package python2-qpid-qmf installed but the package python-qpid-qmf is not installed.	
sincerely yours	
icingauserm	

History

#1 - 04/15/2019 09:44 AM - Mario K

In the file /usr/share/katello-installer-base/modules/qpid/manifests/params.pp
I changed the line
\$server_packages = ['qpid-cpp-server', 'qpid-cpp-client', 'python-qpid-qmf', 'python-qpid',]
to
\$server_packages = ['qpid-cpp-server', 'qpid-cpp-client', 'python-qpid',]

this solved my issue. thanks

#2 - 04/15/2019 10:00 AM - Tomer Brisker

- Status changed from New to Resolved

Marking as resolved. Katello 3.2 is no longer supported and the issue seems to have been fixed since then.
