Foreman - Bug #26659

Cannot assign some hosts to VM.

Description

I'm not sure if this is a bug, but the behavior is reproducible every time with the same VMs.

At office, I used VMware vCenter to clone several VMs from a prepared master VM (CentOS7, Puppet Agent installed but disabled and both certificates and cache deleted). Of 11 cloned VMs, there are two I can't match from the computing resource, although both hosts appear in the list after renaming and synchronizing with the puppet master. (Error message, translated from DE: "No host found for the assignment to this VM") I also deleted the hosts several times from Foreman as well as their certificates and caches, but the result didn't change, neither did deleting and re-creating the complete VM.

By the way, synchronization with Puppet works as expected.

Did I miss something, or is this really an error?
