Description	
<p>I finally got foreman talking to Xen via libvirt. Figured out the storage pool definitions and can now create a host. However, it fails to properly instantiate the guest due to the following error:</p> <p>"Failed to create a compute test (Libvirt) instance test2.xxxx.com: Call to virNetworkCreateXML failed: XML description for unknown volume format raw is not well formed or invalid "</p> <p>I've tried both raw and qcow2 (my only two options). I'm trying this as xen not KVM. My ultimate goal is Citrix, but i'm still working on getting libxenserver/libvirt compiled and cooperating. Until then I'm trying to get a "supported" config working.</p> <p>Any thoughts would be appreciated. Does anyone have a transcript or howto they used to get provisioning to Xen working (preferable not KVM)</p>

- Description updated

Hello,

Currently Xen is not supported on Foreman even though Foreman use libvirt. A PR is being working on to add this functionality.

Regards
