Pull request:		
Description I've been working on getting foreman to provision to xen and Citrix Xen. I have libvirt communicating with both via virsh -c xenapi://1.1.1.1/?no_verify=1 and I can issue commands. However I must manually authenticate. How do I configure compute resources to authenticate?

- Status changed from New to Rejected

This isn't really an appropriate place to ask questions about something we don't support, maybe a discussion on the foreman-dev mailing list would be more appropriate if it's functionality you're writing?

libvirt has config for authenticating to various hypervisors, see http://libvirt.org/auth.html#Auth_client_config
