Fixes #29039 - Make foreman::config::apache standalone

By not relying on the foreman class parameters, it becomes easier to use this class without Foreman. This can be useful when deploying it using a git checkout rather than packages.

Refs #29039 - Use loose coupling to Foreman's Apache config

By only including the Apache config, we get only what we really need.

By using only the Apache config, it's possible to use the Apache config without Foreman installed.

- Move the repo_export_dir to application.pp

The repo export directory default matches with the pulp_export_destination setting. This means it's only needed on a Katello application server, not on a Pulp server.

By creating an anchor, we can collect this if needed and otherwise fall back to a simple mkdir -p. By ordering these it should be idempotent, guarantee the correct permissions on /var/lib/pulp and the katello-export subdirectory.
