Description		
<p>If I use Foreman/Katello behind a HTTP-Proxy and need to configure the noproxy-settings, there is an array found under Administer -> Settings -> General -> HTTP proxy except hosts This can be an empty array like []</p> <p>If I want to specify an array including IPv6 or using wildcards, I get an array like [localhost, 127.0.0.1, "[:::1]", "*.example.com"] Please note that I cannot specify the wildcard or IPv6 without using " " or ' ' around it, otherwise I get error messages during the save-process.</p> <p>After I save the array it is shown correctly - however after reloading the page it gets transformed into [localhost, 127.0.0.1, [:::1], *.example.com] but it still seems to work. When I now want to edit the setting again to add or change something I have to apply the " " or ' ' around every setting for IPv6 or wildcard again to be able to save the changes.</p> <p>This might be a minor issue, but maintaining infrastructures with several smartproxies and other components, that have to be excluded here, you don't want to adapt every subject in this array.</p> <p>This issue exists since many releases and is still found in Foreman 1.24.2</p>
