<b>Description</b>	
When Foreman setting "Append domain names to the host" is set to no:  puppet.conf "certname" has the shortname autosign.conf has the FQDN  They probably should both have the shortname, but they certainly should match!  Foreman 2.5.4-1	

#### History

##### #1 - 10/26/2022 03:31 PM - Robert Eden

stand by... I think the issue only occurs when the host is edited. I deleted and recreated and it autosign had a short-name. Let me confirm the steps to duplicate.

##### #2 - 10/26/2022 04:19 PM - Robert Eden

- *Subject changed from certname doesn't match autosign.conf when "Append domain names to the host" is no to autosign.conf gets FQDN when "Append domain names to the host" is no and a host is rebuilt*

puppet.conf certname has short name (as it should)

the problem is with autosign.conf

steps to reproduce

1. create host (autosign has short name)
2. cancel build (autosign removes short name)
3. initiate build (autosign gets FQDN **BUG**)
4. cancel build (autosign still has FQDN... (it will remove short\_name if you put it back after step 3!))

##### #3 - 10/26/2022 04:50 PM - Robert Eden

I noticed when the rebuild host boots, it shows up as a new host (host list has 2 with the same short-name).. so maybe the issue is with the "cancel"/"build" process and the puppet side is only a symptom. I don't know enough about foreman internals to tell.
