Description	
<p>Previously with the redhat_register template I was able to pass in a subscription_manager_certpkg_url which configured subscription manager to use the satellite instance. It seems this should be configurable with the new commands as well.</p> <p>It seems we just need to make these configurable to something else if katello is not installed.</p> <pre>subman_hostname = "--server-hostname #{@host.content_source.rhsm_url.host}" if (plugin_present?('katello') && @host.content_source) subman_rhsm_baseurl = "--rhsm-baseurl #{@host.content_source.pulp_content_url}" if (plugin_present?('katello') && @host.content_source)</pre> <p>A side note is that the above rhsm commands are not documented in RedHat's documentation. https://access.redhat.com/documentation/en-us/red_hat_enterprise_linux/9/html/performing_an_advanced_rhel_9_installation/kickstart-commands-and-options-reference_installing-rhel-as-an-experienced-user#rhsm_kickstart-commands-for-installation-program-configuration-and-flow-control</p>
