Bugzilla link:		Red Hat JIRA:
Pull request:	https://github.com/theforeman/foreman-packaging/pull/9564	
Description <p>Today you can install foreman-installer and/or foreman-installer-katello. The former contains just the foreman scenario which means the --scenario option is not needed. If you install the latter then you have 3 scenarios installed, so it's mandatory to pass the option.</p> <p>The proposal is to create one package per scenario, with some common packages. Each scenario package will be named foreman-installer-scenario-%scenario. There will be a foreman-installer-common package which holds the Puppet modules, Hiera data and other shared files. The foreman-installer package itself will be a transitional package that requires foreman-installer-scenario-foreman for a smooth migration.</p>
