Description

Current state

The **Register hosts** page uses curl for registering hosts. This seems to be a good approach for EL based systems as most of these come with curl preinstalled. On Debian based systems this is not always the case (at least for recent versions of Debian and Ubuntu).

Proposal

This feature request aims to provide an option to use wget for registering hosts as wget is as widely used as curl. By this system administrators that only have wget installed are not forced to also install curl anymore.
