

Foreman - Bug #3900

Class removed because invalid syntax validation

12/17/2013 04:36 PM - Andrei Burd

Status: New	
Priority: Normal

Pull request:	
Description	
<p>Hi!</p> <p>I recently made the following change in the manifest:</p> <pre>nginx::server { 'repo': listen_port => '7897', - sname => "repo", + sname => "repo repo-#{downcase(::\$location)}.rvzr.net", docroot => '/var/repo' }</pre>	
<p>That lead to deleting the class from the class as as I understood because of validation problems, but puppet applied everything ok. and because of Bug #2394 it did delete class from one of the hosts that lead to production issues.</p>

- Related to Bug #2289: smart-proxy should warn when it cannot read some puppet module file or directory added

#8 - 09/27/2016 05:47 AM - Dominic Cleal

[#15095](#) provides a smart proxy API with the error information, however [#7086](#) should probably be implemented first to make use of it.

Implementing this may need some memorising of which class was imported from *where*, so when a syntax error occurs it can skip classes originally imported from the file with the error.
