Description

I have run into the issue that the dhcpd.conf options do not reflect what foreman is setting when it adds a hosts on ISC DHCPD on Debian 7.3.

In the DHCPD.conf I have :

1. PXE Handoff.
   next-server 10.26.26.51;
   filename "tftpboot/pxelinux.0";

But forman pushes :
omshell: executed - set statements = "filename = \"pxelinux.0\"; next-server = 0a:1a:1a:33; option host-name = \"lab-dhcpdns-test.lab....<snip>

This is without the extar folder and as such the host wont boot, the reason I have folders on my tftp is simepl it is a shared NFS share mounted into various locations and also has folders for firewall , router and switch images/configs and the folders keep it organised. But alo this enables me to not have multiple locations with the same boot images etc.

Thanks.
I would like to see some more control over these options either via the settings interface or maybe on a foreman-proxy config level already.
